The sinking of the RMS Titanic on April 15, 1912, remains one of the most infamous maritime disasters in history. The British government launched a thorough investigation into the tragedy, which uncovered a wealth of evidence and provided invaluable insights into the causes of the sinking.

The Inquiry Process

The British inquiry was conducted by a Merchant Shipping Act Inquiry Court, led by Lord Mersey. The court convened in London on May 2, 1912, and heard testimony from over 100 witnesses, including survivors, crew members, and experts.

The inquiry meticulously examined every aspect of the disaster, from the construction of the Titanic to the conduct of the crew during the evacuation.

The court also considered evidence from scientific experts and engineers.

Key Findings

The British inquiry concluded that the following factors contributed to the sinking of the Titanic:

- **Insufficient lifeboats:** The Titanic had only enough lifeboats for around half the number of passengers and crew on board.
- **Substandard construction:** The Titanic's hull was made of steel plates that were too brittle and prone to cracking.
- **Lack of warning:** The Titanic received ice warnings but failed to take appropriate evasive action.
- **Incompetent crew:** The crew was not adequately trained for emergencies and did not follow proper evacuation procedures.

Impact of the Inquiry

The British inquiry had a profound impact on maritime safety regulations worldwide. The inquiry's recommendations led to significant changes in the design and construction of passenger ships, as well as the establishment of new safety protocols.

The inquiry also helped to raise public awareness about the importance of maritime safety. The tragedy of the Titanic became a catalyst for improved safety standards and regulations, which have helped to prevent similar disasters from occurring.
